

## **TS-920 & TS-820: A New Generation of Advanced Conference Systems**

With nearly a year and a half of not being able to meet in person we are now in a period of transition. The meeting and exhibition industry, so devastated by Covid-19, is now beginning to open back up and keen to get back on track. Venues will be looking to provide the best experience for organisers, presenters and delegates in order to encourage repeat business in a competitive industry. The hospitality and events sector need to be at the forefront of understanding what is required to create technical flexibility when it comes to running conferences, both virtually and in person.

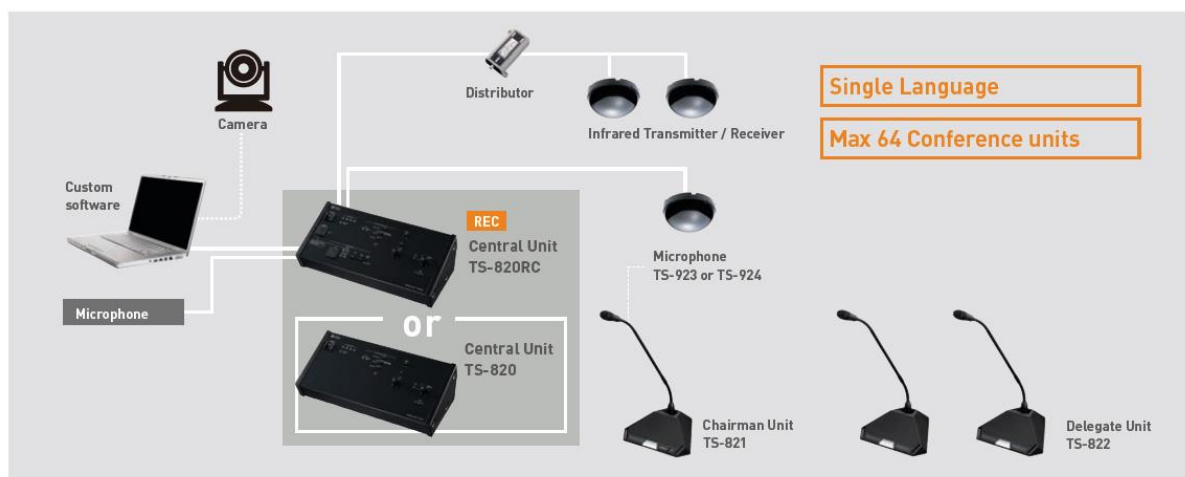

Applying infrared technology to delegate-based audio solutions gives a completely wireless option. It allows systems to be more portable and helps reduce both set up times and the need to have room specific systems. They are ideal for the diverse formats that conferences and meetings require providing a flexible system with clear sound amplification that can be adjusted easily.

At TOA we have developed two infrared conference systems that enable venues to select the best option for their spaces:

The TS-920 Series comes with dual language capabilities, allows for voting and can allow for up to 192 conference units and includes a recording function. The system is split into individual products so that you can tailor-make your system design to suit the venue and includes two options of infrared transmitters/receivers, allowing for any differences in ceiling height in your application.

The TS-820 is a single language system with a maximum of 64 conference units. It comes with the option of two versions of the central unit – the RC version can also record. Both systems provide high quality sound with natural voice transmission.
